

INSTALL GUIDE

Wheels Design Studio

Email Connector

How to connect the "Email Design Files" button on your website to your Magento store, so submitted designs land in your inbox automatically.

5 steps · about 15 minutes

What you're about to do

You were sent a file called `Wheels_DesignStudio.zip`. It contains a small add-on for your Magento store. Nothing already on your site gets changed or deleted — this only adds new pieces. Here's the order of operations:

- 1 Unzip the file and copy one folder onto your server
- 2 Run 4 short commands to switch it on
- 3 Fill in 4 settings in your Magento admin panel
- 4 Change one line on your website
- 5 Test it

BEFORE YOU START

Steps 1 & 2 need someone with access to your web server / hosting (FTP, SSH, or your developer). Steps 3, 4, and 5 can be done by anyone with admin access to the store.

1

Copy the folder onto your server

This is the only file-copying step.

Unzip `Wheels_DesignStudio.zip`. Inside, you'll find a folder called `app`.

WHERE IT GOES

Copy that `app` folder into the main Magento folder on your server, so it merges in and you end up with a new folder at exactly this path:

```
<your-magento-folder>/app/code/Wheels/DesignStudio/
```

Think of it like dropping a new folder into an existing filing cabinet — you're not replacing any drawer that's already there, just adding one more folder labeled "Wheels → DesignStudio".

HOW TO COPY IT

- If you use FTP/SFTP (FileZilla, Cyberduck, etc.): connect to your server, navigate to the Magento root folder, and drag the `app` folder in.
- If you use SSH: unzip the file directly on the server inside the Magento root folder.
- If someone else manages your hosting: forward them the ZIP and this guide — this step is exactly what to ask them to do.

2

Switch it on

4 commands, run once.

Whoever has terminal/SSH access to the server needs to run these commands from inside the Magento root folder, in this order:

```
php bin/magento module:enable Wheels_DesignStudio
php bin/magento setup:upgrade
php bin/magento setup:di:compile
php bin/magento cache:flush
```

What each one does, in plain terms:

- `module:enable` — tells Magento the new piece exists
- `setup:upgrade` — installs it properly
- `setup:di:compile` — gets everything talking to each other
- `cache:flush` — clears the cache so the changes show up

IF YOUR STORE IS ON ADOBE COMMERCE CLOUD / A MANAGED HOST

These commands are sometimes run automatically during a deployment instead of by hand. If a command is blocked, that's normal — it just means this step needs to be added to your deploy process instead of run directly. Your host or developer will recognize this.

3

Fill in the settings

Done inside your normal Magento admin panel — no code.

Log into your Magento admin and go to:

Stores → Settings → Configuration → **Wheels** → **Design Studio**

You'll see 5 fields. Fill them in like this:

1. **Enable Design Submissions** — set to **Yes**
2. **Production Recipient Email** — the inbox that should receive finished designs (e.g. your production/design department's email)
3. **CC Email** — optional, leave blank if you don't need a second copy
4. **Magento Sender Identity** — pick one of the sender names already set up under Stores → Configuration → General → Store Email Addresses
5. **Maximum Upload Size (MB)** — leave at 25 unless you have a reason to change it

Click **Save Config** in the top-right corner.

4

Point the button at it

One line, changed once.

Somewhere in your website's HTML (wherever the Design Studio pages live), there's a line that currently looks like this — it's empty because nothing was built yet:

```
<meta name="wheels-design-email-endpoint" content="">
```

Change it to this:

```
<meta name="wheels-design-email-endpoint" content="https://wheelsauto.com/rest/V1/wheels-design/">
```

That's the only frontend change required. The button and all the ZIP-building logic already exist on your site — they were just waiting for this address to send to.

5

Test it

Make sure a real design actually arrives.

- ☐ Open the Design Studio page on your live site
- ☐ Build any simple design
- ☐ Click **Email Design Files**
- ☐ You should see a message saying it was sent successfully
- ☐ Check the inbox you set as the Production Recipient Email — the design and a ZIP file should be there within a minute or two

IF IT DOESN'T WORK

- **Nothing happens / error immediately:** double-check the address in Step 4 is typed exactly right, with no extra spaces.
- **"Design Studio is not fully configured yet":** go back to Step 3 and make sure Recipient Email is filled in and Save Config was clicked.
- **"Design Studio submissions are currently disabled":** the Enable toggle in Step 3 isn't set to Yes.
- **Email never arrives:** check your store's spam folder first, then confirm the store's outgoing email (Stores → Configuration → Advanced → System → Mail Sending Settings) is still working normally.
